Software Engineer · Distributed Systems, Real-Time Infrastructure & Applied AI

Computer Science student and 0-to-1 engineer who designs and ships complex, reliable systems end to end: distributed microservices, real-time low-latency pipelines, and applied AI. I optimize for performance, correctness, and reliability, and the systems below run in production and at competition scale.

EXPERIENCE

Social Gravity AI, Inc., Founding Engineer

Remote · Mar 2026 – Present

- Co-built and own a production AI platform on a four-service distributed architecture (React frontend, Deno edge services, Python workers, Supabase Postgres; 119 serverless functions, 135 schema migrations) deployed across Vercel, Railway, and LiveKit; beta ran 2,500+ conversations and 73,000+ minutes of dialogue in two weeks.
- Engineered a real-time, low-latency voice pipeline (LiveKit, Deepgram, GPT-4o, Cartesia) with voice-activity and turn detection; cut per-request cold starts by 30 to 60s through model prewarming.
- Designed an event-driven state machine that separates control flow (deterministic) from inference (LLM) with confidence-scored intent inference; built an agentic data pipeline across 24+ sources with diarized speaker-to-face matching for correctness.

Findable, Co-Founder (Engineering)

Remote · Apr 2026 – Present

- Built the product and engineering for an SEO / GEO agency that took a major German retailer from near-zero visibility in AI assistants (ChatGPT, Perplexity, Claude, Gemini) to cited across the DACH market.

UpSale, Head of Growth & Post-Production

Remote · Sep 2024 – Mar 2025

- Led growth and content production for a European social-media agency; grew client accounts by 10,000 to 20,000+ followers per year on under EUR 200 per month in ad spend.

PROJECTS

Steward, local-first AI assistant (live)

2026 · github.com/jeeevan11/steward-app

- Built a concurrent, multi-process system (Python engine, native macOS Swift app, Node relay, FastAPI/React console) with a crash-safe, exactly-once processing ledger and double-send guards; fail-safe and fully on-device by design.
- ~21,500 LOC Python + ~3,000 LOC Swift; ~550 tests; multi-provider LLM routing; reliability invariants enforced and machine-verified in code.

Meta x PyTorch OpenEnv Hackathon, Top 100 of 35,000+ teams

Apr 2026 · Team WooshiWooshi

- Built custom reinforcement-learning environments (Gymnasium / OpenEnv, FastAPI + WebSocket, Dockerized to Hugging Face Spaces); trained a MaskablePPO agent (50k steps in about 90s on CPU, scoring 78.85 vs a 68.43 heuristic) and a Qwen2.5-1.5B + LoRA + GRPO agent. The edge was environment and reward design, not model scale.
- Fundamentals & more:** implemented a byte-pair-encoding tokenizer from scratch in pure Python (Sennrich algorithm); built a Java / Spring Boot CRUD service and an automated MCQ-solving agent (Playwright, Pydantic, Streamlit). 10+ more shipped projects at github.com/jeeevan11.

SKILLS

Languages: Python · Java · JavaScript / TypeScript · SQL · Swift · HTML/CSS

Core CS: data structures & algorithms · software design · distributed systems · concurrency & crash-safe processing · performance & reliability · debugging

AI / ML: applied LLMs · agentic & multi-agent systems · real-time voice (LiveKit, Deepgram, Cartesia) · reinforcement learning (Gymnasium, PyTorch, MaskablePPO, LoRA / GRPO) · RAG · Hugging Face

Web / Backend: React (18/19) · Next.js (App Router, RSC) · Node / Express · Deno · FastAPI

Infra / Tools: Supabase (Postgres, RLS, Auth) · Docker · Vercel · Railway · Git · Playwright / Puppeteer

EDUCATION

Birla Institute of Technology and Science, Pilani (BITS Pilani)

2024 – 2028 · CGPA 8.21

B.Sc. (Hons.) Computer Science · Relevant coursework: Data Structures & Algorithms, Operating Systems, Computer Organization & Architecture, DBMS, Object-Oriented Programming.
